

Elle is a herpetologist (studying snakes) for the University of Australian Wildlife. Elle hit a brick wall with her research and now has to run complex climate and biodiversity simulations to determine habitat changes for snakes. These simulations will generate considerably more data that needs to be stored and shared with collaborators around the country. Elle heard from a colleague that there are national eResearch providers that can help by providing her with access to the services she needs.

Find out how these providers can help Elle by playing the game.

National eResearch Infrastructure Supporting Researchers

National eResearch infrastructure supporting researchers

Having a national ICT infrastructure that supports research impact and excellence is critical to drive economic, environmental, health and social benefits for Australia. Australian Access Federation (AAF), Australia's Academic and Research Network (AARNet), Australian National Data Service (ANDS), National eResearch Collaboration Tools and Resources (NeCTAR) and Research Data Services (RDS) work in collaboration to provide services and support for the eResearch sector.

For more information on how these organisations can help optimise outcomes for your research project, please contact your institution's eResearch team.
